

Understanding Amniotic Dressings

What They Are and How They Help Wounds Heal

What Are Amniotic Dressings?

Amniotic dressings are advanced wound care products made from donated human amniotic membrane - the same protective layer that surrounds a baby during pregnancy. These dressings are carefully processed and sterilized for medical use.

They are safe, natural, and full of healing properties that support wound recovery.

How Do They Work?

Amniotic dressings help wounds heal by:

- Reducing inflammation
- Promoting new tissue growth
- Helping control infection
- Creating a moist, protected environment for faster healing
- Reducing scar tissue formation

What Types of Wounds Can Benefit?

Amniotic dressings are often used for:

- Diabetic foot ulcers
- Venous or arterial ulcers
- Pressure injuries
- Surgical wounds that won't heal
- Chronic or non-healing wounds

What Should I Expect During Treatment?

- ✓ The dressing may be applied in your home by a wound care provider
- ✓ It may be placed once or multiple times depending on your wound
- ✓ A regular dressing will go on top to keep it in place
- ✓ You may be asked to limit movement or pressure to the area
- ✓ You should continue following your wound care instructions carefully

Is It Safe?

Yes. Amniotic tissue is donated by healthy mothers during planned C-sections. The tissue goes through strict screening and sterilization to ensure safety and sterility.

How We Use Amniotic Dressings

Our mobile wound care team may recommend amniotic dressings if your wound isn't healing well with standard treatment. We will:

- Assess your wound type and healing progress
- Apply the dressing safely and monitor the response
- Combine with other therapies to support your recovery
- Keep you informed every step of the way
